HOW TO USE THIS MANUAL

This service manual describes the service procedures for the CB1100SF.

Follow the Maintenance Schedule (Section 3) recommendations to ensure that the vehicle is in peak operating condition.

Performing the first scheduled maintenance is very important. It compensates for the initial wear that occurs during the break-in period.

Sections 1 and 3 apply to the whole motorcycle. Section 2 illustrates procedures for removal/installation of components that may be required to perform service described in the following sections. Sections 4 through 20 describe parts of the motorcycle, grouped according to location.

Find the section you want on this page, then turn to the table of contents on the first page of the section.

Most sections start with an assembly or system illustration, service information and troubleshooting for the section.

The subsequent pages give detailed procedure.

If you don't know the source of the trouble, go to section 22 Troubleshooting.

GENERAL SAFETY

CARBON MONOXIDE

If the engine must be running to do some work, make sure the area is well ventilated. Never run the engine in an enclosed area.

▲WARNING

The exhaust contains poisonous carbon monoxide gas that can cause loss of consciousness and may lead to death.

Run the engine in an open area or with an exhaust evacuation system in an enclosed area.

GASOLINE

Work in a well ventilated area. Keep cigarettes, flames or sparks away from the work area or where gasoline is stored.

▲WARNING

Gasoline is extremely flammable and is explosive under certain conditions. KEEP OUT OF REACH OF CHILDREN.

HOT COMPONENTS

▲WARNING

Engine and exhaust system parts become very hot and remain hot for some time after the engine is run. Wear insulated gloves or wait until the engine and exhaust system have cooled before handling these parts.

USED ENGINE OIL

▲WARNING

Used engine oil may cause skin cancer if repeatedly left in contact with the skin for prolonged periods. Although this is unlikely unless you handle used oil on a daily basis, it is still advisable to thoroughly wash your hands with soap and water as soon as possible after handling used oil. KEEP OUT OF REACH OF CHILDREN.

BRAKE DUST

Never use an air hose or dry brush to clean the brake assemblies.

BRAKE FLUID

CAUTION:

Spilling fluid on painted, plastic or rubber parts will damage them. Place a clean shop towel over these parts whenever the system is serviced. KEEP OUT OF REACH OF CHILDREN.

GENERAL INFORMATION

COOLANT

Under some conditions, the ethylene glycol in engine coolant is combustible and its flame is not visible. If the ethylene glycol does ignite, you will not see any flame, but you can be burned.

▲WARNING

- *Avoid spilling engine coolant on the exhaust system or engine parts. They may be hot enough to cause the coolant to ignite and burn without a visible flame.*
- *Coolant (ethylene glycol) can cause some skin irritation and is poisonous if swallowed. KEEP OUT OF REACH OF CHILDREN.*
- *Do not remove the radiator cap when the engine is hot. The coolant is under pressure and could scald you.*
- *Keep hands and clothing away from the cooling fan, as it starts automatically.*

CAUTION:

Using coolant with silicate inhibitors may cause premature water of water pump seals or brockage of radiator passages. Using tap water may cause engine damage.

SERVICE RULES

1. Use genuine HONDA or HONDA-recommended parts and lubricants or their equivalents. Parts that don't meet HONDA's design specifications may cause damage to the motorcycle.
2. Use the special tools designed for this product to avoid damage and incorrect assembly.
3. Use only metric tools when servicing the motorcycle. Metric bolts, nuts and screws are not interchangeable with English fasteners.
4. Install new gaskets, O-rings, cotter pins, and lock plates when reassembling.
5. When tightening bolts or nuts, begin with the larger diameter or inner bolt first. Then tighten to the specified torque diagonally in incremental steps unless a particular sequence is specified.
6. Clean parts in cleaning solvent upon disassembly. Lubricate any sliding surfaces before reassembly.
7. After reassembly, check all parts for proper installation and operation.
8. Route all electrical wires as show on pages 1-24 through 1-35, Cable and Harness Routing.

BATTERY HYDROGEN GAS & ELECTROLYTE

▲WARNING

- *The battery gives off explosive gases; keep sparks, flames and cigarettes away. Provide adequate ventilation when charging.*
- *The battery contains sulfuric acid (electrolyte). Contact with skin or eyes may cause severe burns. Wear protective clothing and a face shield.*
 - *If electrolyte gets on your skin, flush with water.*
 - *If electrolyte gets in your eyes, flush with water for at least 15 minutes and call a physician immediately.*
- *Electrolyte is poisonous.*
 - *If swallowed, drink large quantities of water or milk and follow with milk of magnesia or vegetable oil and call a physician. KEEP OUT OF REACH OF CHILDREN.*

EMISSION CONTROL SYSTEMS

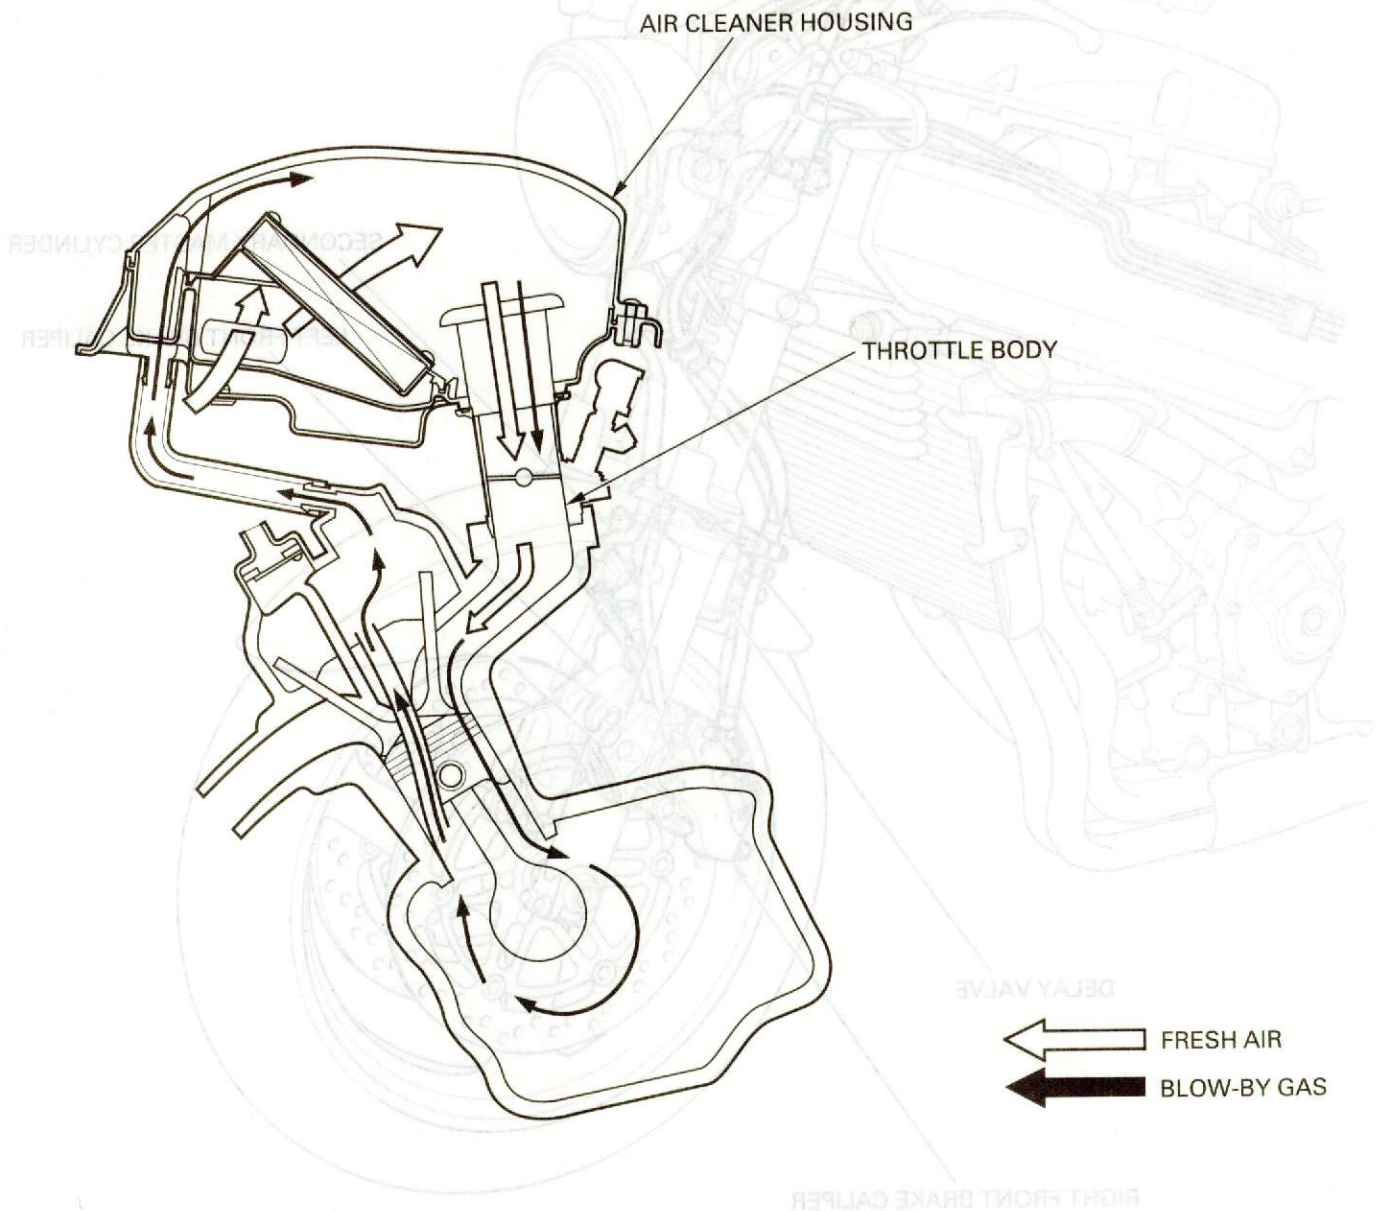

SOURCE OF EMISSIONS

The combustion process produces carbon monoxide and hydrocarbons. Control of hydrocarbons is very important because, under certain conditions, they react to form photochemical smog when subjected to sunlight. Carbon monoxide does not react in the same way, but it is toxic.

Honda Motor Co., Ltd. utilizes lean injection settings as well as other systems, to reduce carbon monoxide and hydrocarbons.

CRANKCASE EMISSION CONTROL SYSTEM

The engine is equipped with a closed crankcase system to prevent discharging crankcase emissions into the atmosphere. Blow-by gas is returned to the combustion chamber through the air cleaner and throttle body.

EXHAUST EMISSION CONTROL SYSTEM (SECONDARY AIR SUPPLY SYSTEM)

The exhaust emission control system is composed of a lean fuel injection setting, and no adjustments should be made except idle speed adjustment with the throttle stop screw. The exhaust emission control system is separate from the crankcase emission control system.

The exhaust emission control system consists of a secondary air supply system which introduces filtered air into the exhaust gases in the exhaust port. Fresh air is drawn into the exhaust port by the function of the PAIR (Pulse Secondary Air Injection) control valve.

This charge of fresh air promotes burning of the unburned exhaust gases and changes a considerable amount of hydrocarbons and carbon monoxide into relatively harmless carbon dioxide and water vapor.

The reed valve prevent reverse air flow through the system. The PAIR control valve is operated by the solenoid valve. The solenoid valve is controlled by the PGM-FI unit, and the fresh air passage is opened/closed according to the running condition (ECT/IAT/TP/MAP sensor and engine revolution).

No adjustments to the secondary air supply system should be made, although periodic inspection of the components is recommended.

GENERAL INFORMATION

NOISE EMISSION CONTROL SYSTEM

TEMPERING WITH THE NOISE CONTROL SYSTEM IS PROHIBITED: Local law prohibits the following acts or the causing thereof: (1) The removal or rendering in operative by any person, other than for purposes of maintenance, repair or replacement, of any device or element of design incorporated into any new vehicle for the purpose of noise control prior to its sale or delivery to the ultimate purchaser or while it is in use; (2) the use of the vehicle after such device or element of design has been removed or rendered inoperative by any person.

AMONG THOSE ACTS PRESUMED TO CONSTITUTE TEMPERING ARE THE ACTS LISTED BELOW:

1. Removal of, or puncturing of the muffler, baffles, header pipes or any other component which conducts exhaust gases.
2. Removal of, or puncturing of any part of the intake system.
3. Lack of proper maintenance.
4. Replacing any moving parts of the vehicle, or parts of the exhaust or intake system, with parts other than those specified by the manufacturer.

GENERAL

▲WARNING

- Gasoline is extremely flammable and is explosive under certain conditions. KEEP OUT OF REACH OF CHILDREN.
- Serious burns may result if the exhaust system is not allowed to cool before components are removed or serviced.

- Work in a well ventilated area. Smoking or allowing flames or sparks in the work area or where gasoline is stored can cause a fire or explosion.
- This section covers removal and installation of the body panels and exhaust system.
- Always replace the exhaust pipe gaskets after removing the exhaust pipe from the engine.
- When installing the exhaust system, loosely install all of the exhaust pipe fasteners. Always tighten the exhaust pipe clamps first, then tighten the mounting fasteners. If you tighten the mounting fasteners first, the exhaust pipe may not seat properly.
- Always inspect the exhaust system for leaks after installation.

** In the interest of safety, we recommend these items be serviced only by an authorized HONDA dealer.

- NOTES:
1. At higher odometer reading, repeat at the frequency interval established here.
 2. Service more frequently if the motorcycle is ridden in unusually wet or dusty areas.
 3. Replace every 2 years, or at indicated odometer interval, whichever comes first. Replacement requires mechanical skill.

Major adjustments are made with the lower adjuster.
 Remove the air cleaner housing (page 5-80).
 Adjust the free play by loosening the lock nut and turning the adjuster.
 After adjustment, tighten the lock nut securely.
 Check the throttle operation.
 Replace any damaged parts, if necessary.

FUEL LINE

Support the rear end of the fuel tank (page 2-11).

Check the fuel lines for deterioration, damage or leakage. Replace the fuel line if necessary.

Install the fuel tank in the reverse order of removal.

THROTTLE OPERATION

Check for smooth throttle grip full opening and automatic full closing in all steering positions. Check the throttle cables and replace them if they are deteriorated, kinked or damaged. Lubricate the throttle cables, if throttle operation is not smooth.

Measure the free play at the throttle grip flange.

FREE PLAY: 2–6 mm (1/16–1/4 in)

Throttle grip free play can be adjusted at either end of the throttle cable.

Minor adjustments are made with the upper adjuster. Adjust the free play by loosening the lock nut and turning the adjuster.

Major adjustments are made with the lower adjuster.

Remove the air cleaner housing (page 5-60).

Adjust the free play by loosening the lock nut and turning the adjuster.

After adjustment, tighten the lock nut securely. Recheck the throttle operation. Replace any damaged parts, if necessary.

CHOKE OPERATION

This motorcycle is equipped with a bypass air volume control choke system, controlled by the starter valve.

The starter valve opens a bypass air circuit when the choke knob under the left side of the main frame is pulled ON.

Choke lever operation

Check for smooth operation of the choke knob. Lubricate the choke cable if the operation is not smooth.

Starter valve lever operation

Open and support the rear end of the fuel tank (page 2-11).

Check for smooth operation of the starter valve lever.

There should be no free play.

Set the starter valve lever to fully closed so that the lever contacts the throttle stop screw.

Check that there is a maximum of 1–2 mm (0.04–0.08 in) of free play in the inner choke cable with the choke knob set to fully OFF.

Replace the choke cable if the free play is out of specification.

Install the removed parts in the reverse order of removal.

AIR CLEANER

Disconnect the fuel pump/reserve sensor 3P (Black) connector.

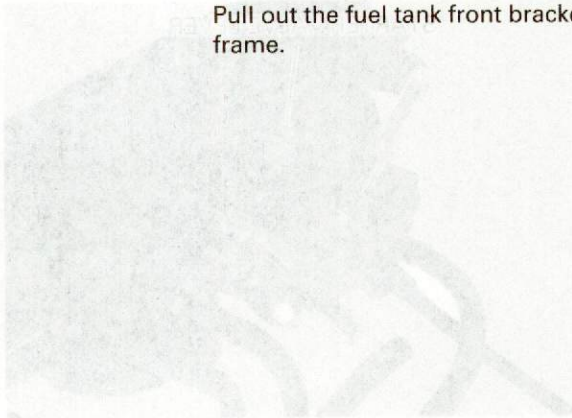

MAINTENANCE

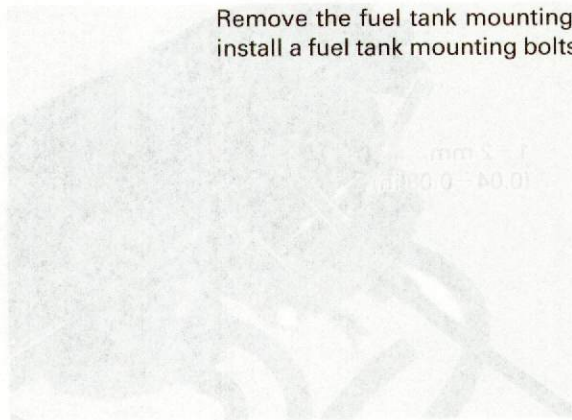

Remove the fuel tank rear mounting bolts.

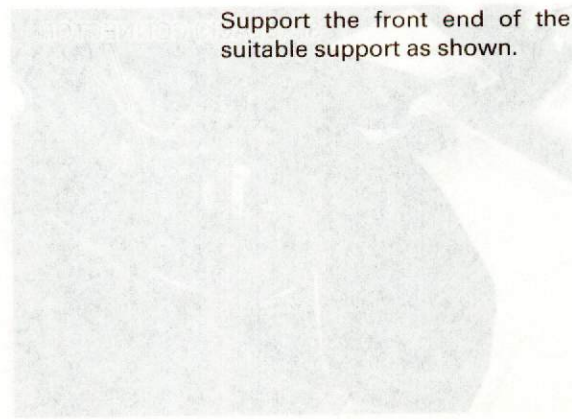

Pull out the fuel tank front bracket rubbers from the frame.

Remove the fuel tank mounting collar, temporarily install a fuel tank mounting bolts.

Support the front end of the fuel tank using a suitable support as shown.

Disconnect the IAT (Intake Air Temperature) sensor connector.

Remove the screws and air cleaner housing cover.

Remove and discard the air cleaner element in accordance with the maintenance schedule (page 3-3).

Also replace the air cleaner element any time it is excessively dirty or damaged.

Install the removed parts in the reverse order of removal.

SPARK PLUG

REMOVAL

CAUTION:

Be careful not to damage the oil cooler and radiator fins.

Remove the radiator grill/side grill mounting bolts and then remove both side grill.

Disconnect the fan motor sub-harness 2P (Natural) connector.

Remove the radiator mounting socket bolt and washer.

MAINTENANCE

Remove the radiator from the upper and lower brackets by moving it to the right, then move the radiator/oil cooler forward as an assembly.

Disconnect the spark plug caps.

NOTE:

Clean around the spark plug bases with compressed air before removing, and be sure that no debris is allowed to enter the combustion chamber.

Remove the spark plug using a equipped spark plug wrench or an equivalent.

Inspect or replace as described in the maintenance schedule.

INSPECTION

Check the following and replace if necessary (recommended spark plug: page 3-1)

- Insulator for damage
- Electrodes for wear
- Burning condition, coloration

If the electrodes is contaminated with accumulated objects or dirt, clean the electrode using the spark plug cleaner.

CAUTION:

- *This motorcycle's spark plug equipped with platinum type electrodes. Do not use wire brush to clean the electrodes.*
- *The plug cleaner should be used with the air pressure of less than 6 kgf/cm² (85 psi) and for less than 20 seconds.*

Always use specified spark plugs on this motorcycle.

Replace the plug if the center electrode is rounded as shown in the illustration.

SPECIFIED SPARK PLUG: CR8EHVX-9 (NGK)

Check the gap between the center and side electrodes with a wire type feeler gauge.

CAUTION:

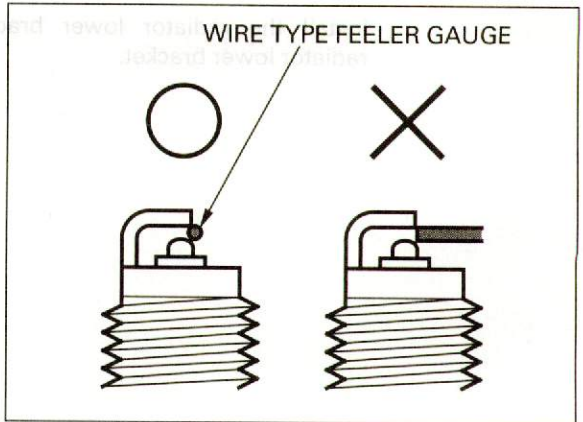

To prevent damaging the platinum coating of the center electrodes, use a wire type feeler gauge to check the spark plug gap.

Make sure that the 1.0 mm (0.04 in) plug gauge does not insert between the gap.

If the gauge can be inserted into the gap, replace the plug with a new one.

CAUTION:

Do not adjust the spark plug gap. If the gap is out of specification, replace with a new one.

Reinstall the spark plug in the cylinder head and hand tighten, then torque to specification.

TORQUE: 12 N·m (1.2 kgf·m , 9 lbf·ft)

If using the new plug, install as follows:

Install and hand tighten the new spark plug, then tighten it about 1/2 turn after the sealing washer contacts the seat of the plug hole.

Install the spark plug caps.

MAINTENANCE

Install the radiator/oil cooler assembly onto the upper bracket.

Install the radiator lower bracket boss to the radiator lower bracket.

Install the washer and radiator upper mounting socket bolt, then tighten the socket bolt. Connect the fan motor sub-harness 2P (Natural) connector.

Install the both side grill, then tighten the radiator grill/side grill mounting bolts securely.

VALVE CLEARANCE

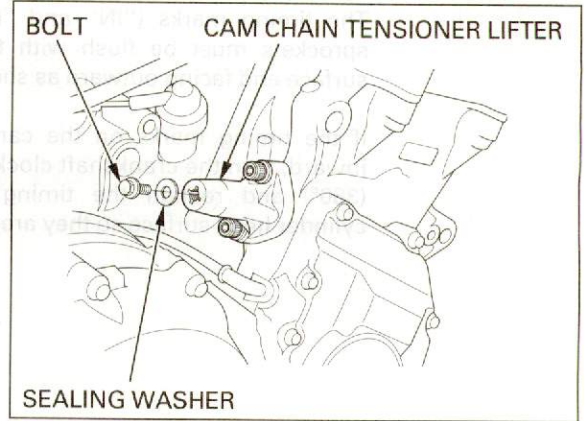

INSPECTION

NOTE:

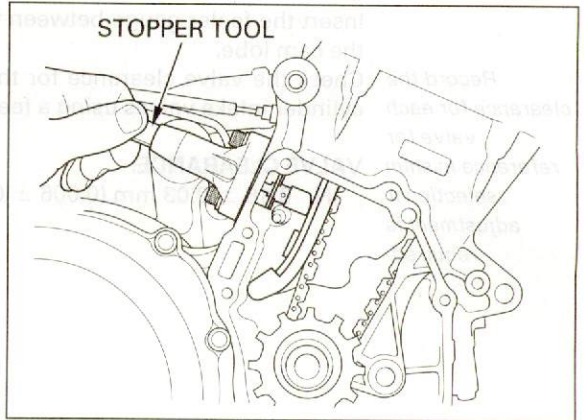

Inspect and adjust the valve clearance while the engine is cold (below 35 °C/95 °F).

Remove the cylinder head cover (page 8-5).

Remove the cam chain tensioner lifter sealing bolt and sealing washer.

Turn the cam chain tensioner lifter shaft fully and secure it using the mechanic's tensioner stopper tool (page 8-6).

Remove the timing hole cap and O-ring.

Turn the crankshaft clockwise, align the "T" mark on the ignition pulse generator rotor with the index mark on the ignition pulse generator rotor cover.

MAINTENANCE

The timing marks ("IN" and "EX") on the cam sprockets must be flush with the cylinder head surface and facing outward as shown.

If the timing marks on the cam sprocket facing inward, turn the crankshaft clockwise one full turn (360°) and realign the timing marks with the cylinder head surface so they are facing outward.

Record the clearance for each valve for reference in shim selection if adjustment is required.

Insert the feeler gauge between the valve lifter and the cam lobe. Check the valve clearance for the No. 1 and No. 3 cylinder intake valves using a feeler gauge.

NOTE:

Sixty-five different thickness shims are available from the thinnest 1.200 mm thickness shim to the thickest 2.800 mm thickness shim in intervals of 0.025 mm.

Calculate the new shim thickness using the equation below.

$$A = (B - C) + D$$

- A: New shim thickness
- B: Recorded valve clearance
- C: Specified valve clearance
- D: Old shim thickness

NOTE:

- Make sure of the correct shim thickness by measuring the shim by micrometer.
- Reface the valve seat if carbon deposit result in a calculated dimension of over 2.800 mm.

1.80 mm	1.825 mm	1.85 mm	1.875 mm

Reinstall the filler cap and dipstick.

ENGINE OIL & FILTER CHANGE

⚠ WARNING

If the engine must be running to do some work, make sure the area is well-ventilated. Never run the engine in an enclosed area. The exhaust contains poisonous carbon monoxide gas that may cause loss of consciousness and may lead to death.

Warm up the engine.

NOTE:

Change the engine oil with the engine warm and the motorcycle on level ground to assure complete draining.

Stop the engine and remove the oil filler cap and drain bolt.
 Drain the oil completely.

CAUTION:

Used engine oil may cause skin cancer if repeatedly left in contact with the skin for prolonged periods. Although this is unlikely unless you handle used oil on a daily basis, it is still advisable to thoroughly wash your hands with soap and water as soon as possible after handling used oil.

Remove and discard the oil filter cartridge using the special tool.

TOOL:
Oil filter wrench

07HAA-PJ70100

ENGINE IDLE SPEED

⚠ WARNING

If the engine must be running to do some work, make sure the area is well-ventilated. Never run the engine in an enclosed area. The exhaust contains poisonous carbon monoxide gas that may cause loss of consciousness and lead to death. Run the engine in an open area or with an exhaust evacuation system in an enclosed area.

NOTE:

- Inspect and adjust the idle speed after all other engine maintenance items have been performed and are within specifications.
- The engine must be warm for accurate idle speed inspection and adjustment.

Support the rear end of the fuel tank (page 2-11).
Warm up the engine for about ten minutes.
Turn the throttle stop screw as required to obtain the specified idle speed.

IDLE SPEED: $1,100 \pm 100 \text{ min}^{-1}$ (rpm)

RADIATOR COOLANT

Check the coolant level of the reserve tank with the engine running at normal operating temperature. The level should be between the "UPPER" and "LOWER" level lines.

If necessary, add recommended coolant.

RECOMMENDED ANTIFREEZE:

High quality ethylene glycol antifreeze containing corrosion protection inhibitors.

Remove the seat (page 2-2).

Remove the reserve tank filler cap and fill to the "UPPER" level line with 50/50 mixture of distilled water and antifreeze.
Reinstall the filler cap.

COOLING SYSTEM

Remove the radiator grill (page 2-4).

Check the radiator air passages for clogging or damage.

Straighten bend fins, and remove insects, mud or other obstructions with compressed air or low water pressure.

Replace the radiator if the air flow is restricted over more than 20 % of the radiating surface.

Inspect the radiator hoses for cracks or deterioration, and replace if necessary.

Check the tightness of all hose clamps and fasteners.

SECONDARY AIR SUPPLY SYSTEM

NOTE:

- This model is equipped built-in secondary air supply system. The pulse secondary air supply system is located on the cylinder head cover.
- The secondary air supply system introduces filtered air into exhaust gases in the exhaust port. The secondary air is drawn into the exhaust port whenever there is negative pressure pulse in the exhaust system. This charged secondary air promotes burning of the unburned exhaust gases and changes a considerable amount of hydrocarbons and carbon monoxide into relatively harmless carbon dioxide and water.

Check the PAIR (pulse secondary air injection) tubes between the PAIR control solenoid valve and cylinder head cover for deterioration, damage or loose connections. Make sure that the hoses are not cracked.

NOTE:

If the hoses show any signs of heat damage, inspect the PAIR check valve in the PAIR reed valve cover for damage.

Check the air suction hose between the air cleaner housing and PAIR control solenoid valve for deterioration, damage or loose connections. Make sure that the hoses are not kinked, pinched or cracked.

DRIVE CHAIN

DRIVE CHAIN SLACK INSPECTION

▲WARNING

Never inspect and adjust the drive chain while the engine is running.

Turn the ignition switch OFF, place the motorcycle on its side stand and shift the transmission into neutral.

Check the slack in the drive chain lower run midway between the sprockets.

25–35 mm (1.0–1.4 in)

CHAIN SLACK: 25–35 mm (1.0–1.4 in)

CAUTION:

Excessive chain slack, 50 mm (2.0 in) or more, may damage the frame.

Lubricate the drive chain with #80–90 gear oil or drive chain lubricant designed specifically for use with O-ring chains. Wipe off the excess oil or chain lubricant.

ADJUSTMENT

Loosen the rear axle nut. Turn both adjusting bolts until the correct drive chain slack is obtained. Make sure the index marks on the both adjusters are aligned with the rear end of the swingarm. Tighten the rear axle nut to the specified torque.

TORQUE: 118 N·m (12.0 kgf·m, 87 lbf·ft)

Recheck the drive chain slack and free wheel rotation.

Lubricate the drive chain with #80–90 gear oil or drive chain lubricant designed specifically for use with O-ring chains. Wipe off the excess oil or chain lubricant.

Check the drive chain wear indicator label attached on the left drive chain adjuster.

If the red zone of the indicator label reaches the end of the swingarm, replace the drive chain with a new one (page 3-22).

CLEANING AND LUBRICATION

Clean the chain with non-flammable or high flash point solvent and wipe it dry.

Be sure the chain has dried completely before lubricating.

Inspect the drive chain for possible damage or wear.

Replace any chain that has damaged rollers, loose fitting links, or otherwise appears unserviceable.

Installing a new chain on badly worn sprockets will cause the new chain to wear quickly.

Inspect and replace sprocket as necessary.

NON-FLAMMABLE OR HIGH FLASH POINT SOLVENT

WIPE AND DRY

SOFT BRUSH

Lubricate the drive chain with #80–90 gear oil or drive chain lubricant designed specifically for use with O-ring chains. Wipe off the excess oil or chain lubricant.

SPROCKETS INSPECTION

Inspect the drive and driven sprocket teeth for wear or damage, replace if necessary.

Never use a new drive chain on worn sprockets.

Both chain and sprockets must be in good condition, or the new replacement chain will wear rapidly.

MAINTENANCE

Check the attaching bolts and nuts on the drive and driven sprockets.
If any are loose, torque them.

TORQUE:

Drive sprocket bolt:

54 N·m (5.5 kgf·m , 40 lbf·ft)

TOOL:

Drive chain tool set 07HMH-MR10103

Remove the drive chain.

Remove the excess drive chain links from the new drive chain with the drive chain tool set.

NOTE:

Include the master link when you count the drive chain links.

STANDARD LINKS: 110 links
REPLACEMENT CHAIN:
DID: DID50ZV-120ZB
RK: RK50LFO-120LJ-FZ

CAUTION:

Never reuse the oil drive chain, master link, master link plate and O-rings.

Assemble the new master link, O-rings and plate.

CAUTION:

Insert the master link from the inside of the drive chain, and install the plate with the identification mark facing the outside.

Assemble and set the drive chain tool set.

TOOL:
Drive chain tool set 07HMH-MR10103

Make sure that the master link pins are installed properly. Measure the master link pin length projected from the plate.

STANDARD LENGTH:
DID: 1.15 – 1.55 mm (0.045 – 0.061 in)
RK: 1.20 – 1.40 mm (0.047 – 0.055 in)

Stake the master link pins.

MAINTENANCE

Make sure that the pins are staked properly by measuring the diameter of the staked area using a slide caliper.

DIAMETER OF THE STAKED AREA:

DID: 5.50–5.80 mm (0.217–0.228 in)

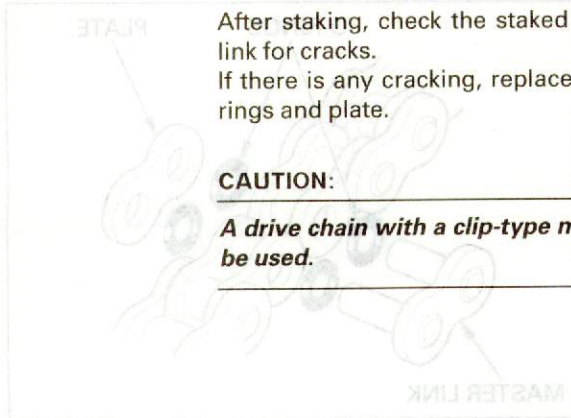

RK: 5.55–5.85 mm (0.219–0.230 in)

After staking, check the staked area of the master link for cracks. If there is any cracking, replace the master link, O-rings and plate.

CAUTION:

A drive chain with a clip-type master link must not be used.

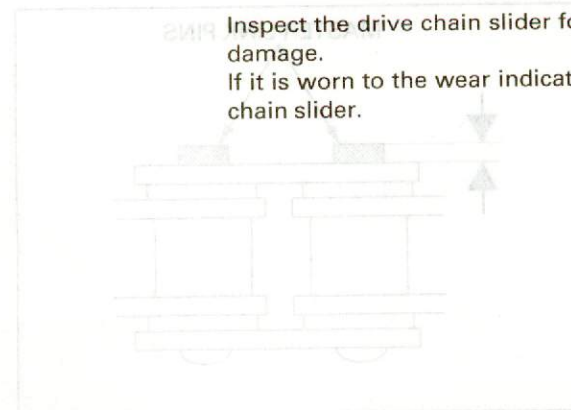

DRIVE CHAIN SLIDER

Remove the bolts and left crankcase rear cover.

Inspect the drive chain slider for excessive wear or damage. If it is worn to the wear indicator, replace the drive chain slider.

BRAKE FLUID

CAUTION:

- Do not mix different types of fluid, as they are not compatible with each other.
- Do not allow foreign material to enter the system when filling the reservoir.
- Avoid spilling fluid on painted, plastic or rubber parts. Place a rag over these parts whenever the system is serviced.

NOTE:

When the fluid level is low, check the brake pads for wear (see below). A low fluid level may be due to wear of the brake pads. If the brake pads are worn, the caliper piston is pushed out, and this accounts for a low reservoir level. If the brake pads are not worn and the fluid level is low, check entire system for leaks (see next page).

FRONT BRAKE

Turn the handlebar to the left so that the reservoir is level and check the front brake fluid reservoir level through the sight glass.

If the level is near the lower level line, check the brake pad wear (see below).

REAR BRAKE

Place the motorcycle on a level surface, and support it upright position.

Check the rear brake fluid reservoir level.

If the level is near the lower level line, check the brake pad wear (see below).

BRAKE PAD WEAR

FRONT BRAKE PADS

Check the brake pad for wear. Replace the brake pads if either pad is worn to the bottom of wear limit groove.

Refer to page 15-10 for brake pad replacement.

REAR BRAKE PADS

Check the brake pad for wear. Replace the brake pads if either pad is worn to the bottom of wear limit groove.

Refer to page 15-11 for brake pad replacement.

BRAKE SYSTEM

INSPECTION

This model is equipped with a Dual Combined Brake System. Check the front and rear brake operation as follows:

Place the motorcycle on its center stand and shift the transmission into neutral.

Push the left front brake caliper upward by hand. Make sure the rear wheel does not turn while the left front brake caliper is pushed.

Jack-up the motorcycle to raise the front wheel off the ground.

CAUTION:

Do not use the oil filter as a jack point.

Apply the rear brake pedal. Make sure the front wheel does not turn while the rear brake pedal is applied.

Firmly apply the brake lever or pedal, and check that no air has entered the system.
If the lever or pedal feels soft or spongy when operated, bleed the air from the system.

Inspect the brake hose and fittings for deterioration, cracks and signs of leakage.
Tighten any loose fittings.
Replace hoses and fittings as required.

Refer to page 15-5 for brake bleeding procedures.

BRAKE LEVER ADJUSTMENT

The distance between the top of the brake lever and the grip can be adjusted by turning the adjuster.

DIRECTION A: Brake lever further away from the grip

DIRECTION B: Brake lever closer to the grip

CAUTION:

Align the allowance on the brake lever with the index mark on the adjuster.

BRAKE PEDAL HEIGHT ADJUSTMENT

Loosen the lock nut and turn the push rod until the correct pedal height is obtained.

BRAKE LIGHT SWITCH

NOTE:

The front brake light switch does not require adjustment.

Adjust the brake light switch so that the brake light comes on just prior to the brake actually being engaged.

If the light fails to come on, adjust the switch so that the light comes on at the proper time.

Hold the switch body and turn the adjuster. Do not turn the switch body.

HEADLIGHT AIM

▲WARNING

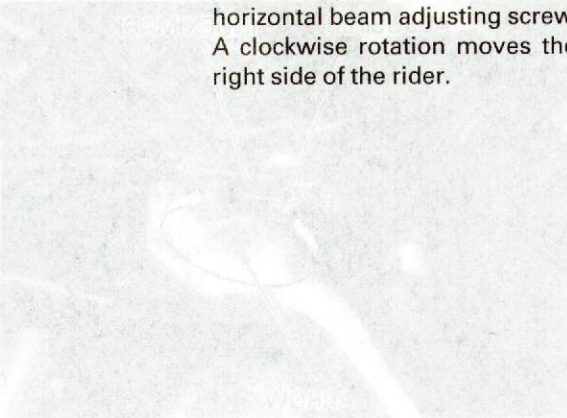

An improperly adjusted headlight may blind oncoming drivers, or it may fail to light the road for a safe distance.

Adjust the headlight beam as specified by local laws and regulation.

Place the motorcycle on a level surface.
Adjust the headlight beam vertically by loosening the headlight case mounting bolts and move the headlight case .

Horizontally beam adjustment are made using the horizontal beam adjusting screw.
A clockwise rotation moves the beam toward the right side of the rider.

CLUTCH SYSTEM

Measure the clutch lever free play at the end of the clutch lever.

Free play: 10–20 mm (3/8–13/16 in)

Minor adjustments are made using the upper adjuster at the clutch lever.
Loosen the lock nut and turn the adjuster.

CAUTION:

The adjuster may be damaged if it is positioned too far out, leaving minimal thread engagement.

If the adjuster is threaded out near its limit and the correct free play cannot be obtained, turn the adjuster all the way in and back out one turn.
Tighten the lock nut and make a major adjustment as described below.

Major adjustments are performed at the clutch arm. Loosen the lock nut and turn the adjusting nut to adjust free play. Hold the adjusting nut securely while tightening the lock nut.

If proper free play cannot be obtained, or the clutch slips during test ride, disassemble and inspect the clutch (see section 9).

SIDE STAND

Support the motorcycle on a level surface.

Check the side stand spring for damage or loss of tension.

Check the side stand assembly for freedom of movement and lubricate the side stand pivot if necessary.

Check the side stand ignition cut-off system:

- Sit astride the motorcycle and raise the side stand.
- Start the engine with the transmission in neutral, then shift the transmission into gear, with the clutch lever squeezed.
- Move the side stand full down.
- The engine should stop as the side stand is lowered.

If there is a problem with the system, check the side stand switch (section 19).

SUSPENSION

▲WARNING

Loose, worn or damaged suspension parts impair motorcycle stability and control. Repair or replace any damaged components before riding. Riding a motorcycle with faulty suspension increases your risk of an accident and possible injury.

FRONT SUSPENSION INSPECTION

Check the action of the forks by operating the front brakes and compressing the front suspension several times.

Check the entire assembly for signs of leaks, damage or loose fasteners.

Replace damaged components which cannot be repaired.

Tighten all nuts and bolts.

Refer to section 13 for fork service.

REAR SUSPENSION INSPECTION

Support the motorcycle on its center stand and raise the rear wheel off the ground.

Hold the swingarm and move the rear wheel sideways with force to see if the wheel bearings are worn.

Check for worn swingarm bearings by grabbing the rear swingarm and attempting to move the swingarm side to side. Replace the bearings if any looseness is noted.

Check the action of the shock absorber by compressing it several times. Check the entire shock absorber assembly for signs of leaks, damage or loose fasteners. Replace damaged components which cannot be repaired. Tighten all nuts and bolts.

Refer to section 14 for shock absorber service.

NUTS, BOLTS, FASTENERS

Check that all chassis nuts and bolts are tightened to their correct torque values (page 1-13). Check that all safety clips, hose clamps and cable stays are in place and properly secured.

WHEELS/TIRES

NOTE:

Tire pressure should be checked when the tires are COLD.

RECOMMENDED TIRE PRESSURE AND TIRE SIZE:

		FRONT	REAR
Tire pressure kPa (kgf/cm ² , psi)		250 (2.50 , 36)	290 (2.90 , 42)
Tire size		120/70 ZR17 (58W)	180/55 ZR17 (73W)
Tire brand	Bridgestone	BT57F RADIAL G	BT57R RADIAL F
	Michelin	MACADAM 90X G	MACADAM 90X M

Check the tires for cuts, embedded nails, or other damage.

Check the front and rear wheels for trueness (refer to section 13 and 14).

Measure the tread depth at the center of the tires. Replace the tires when the tread depth reaches the following limits.

MINIMUM TREAD DEPTH:

FRONT: 1.5 mm (0.06 in)

REAR: 2.0 mm (0.08 in)

STEERING HEAD BEARINGS

NOTE:

Check that the control cables do not interfere with handlebar rotation.

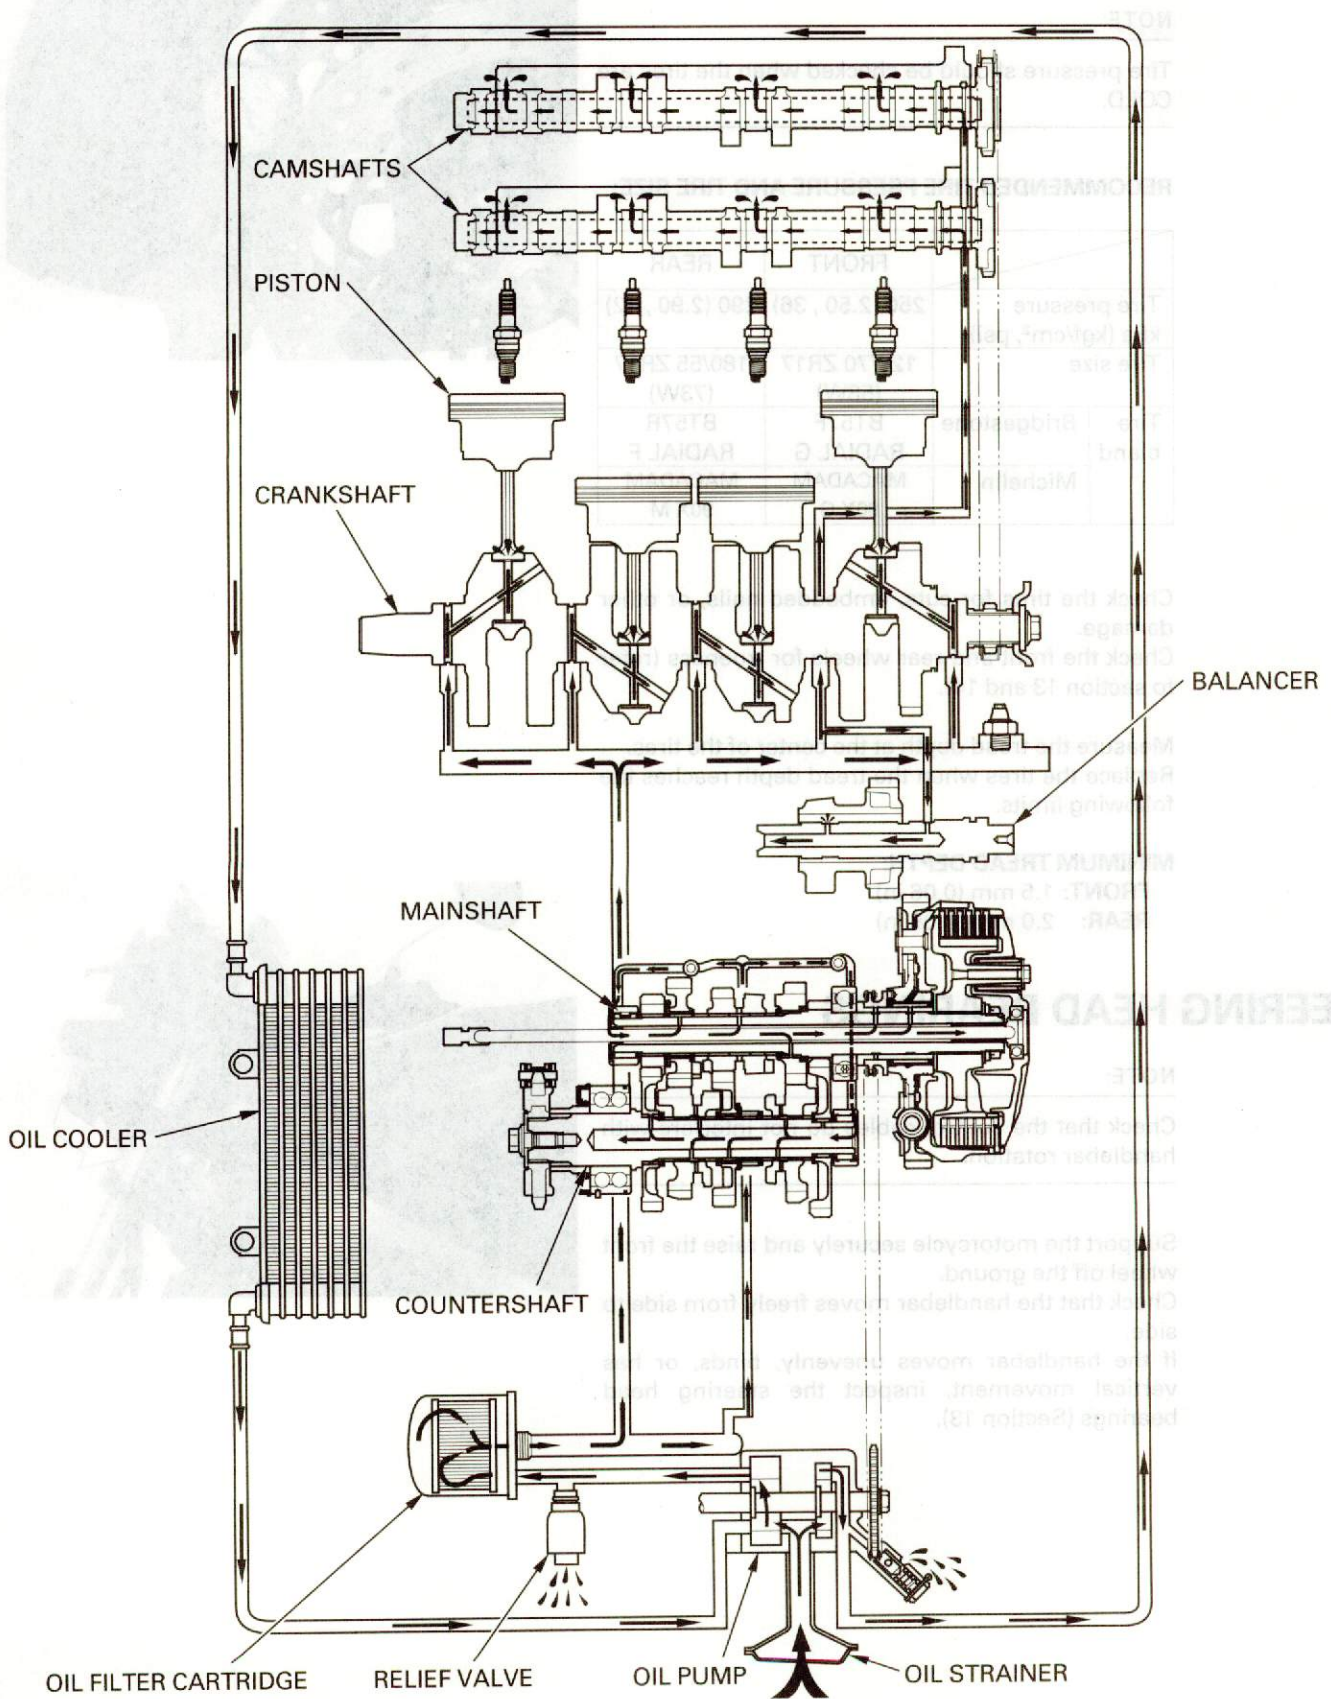

Support the motorcycle securely and raise the front wheel off the ground.

Check that the handlebar moves freely from side to side.

If the handlebar moves unevenly, binds, or has vertical movement, inspect the steering head bearings (Section 13).

SERVICE INFORMATION

GENERAL

▲WARNING

- Gasoline is extremely flammable and is explosive under certain conditions. **KEEP OUT OF REACH OF CHILDREN.**
- Be sure to relieve the fuel pressure while the engine is OFF.
- Bending or twisting the control cables will impair smooth operation and could cause the cables to stick or bind, resulting in loss of vehicle control.

- Work in a well ventilated area. Smoking or allowing flames or sparks in the work area or where gasoline is stored can cause a fire or explosion.

CAUTION:

- Do not apply commercially available carburetor cleaners to the inside of the throttle bore, which is coated with molybdenum.
- Do not snap the throttle valve from full open to full close after the throttle cable has been removed. It may cause incorrect idle operation.
- Seal the cylinder head intake ports with tape or a clean cloth to keep dirt and debris from entering the intake ports after the throttle body has been removed.
- Do not damage the throttle body. It may cause incorrect throttle and idle valve synchronization.
- Prevent dirt and debris from entering the throttle bore, fuel tube and return tube, clean them using compressed air.
- The throttle body is factory pre-set. Do not disassemble in a way other than shown in this manual.
- Do not loosen or tighten the white painted bolts and screws of the throttle body.
Loosening or tightening them can cause throttle and idle valve synchronization failure.
- Tighten the yellow painted bolts and screw of the throttle body to the specified torque. Yellow painted parts of the throttle body not shown in this manual should not be disassembled.
- Do not push the fuel pump base under the fuel tank when the fuel tank is stored.
- Always replace the O-ring when the fuel pump is removed.

FUEL SYSTEM (Programmed Fuel Injection)

NOTE:

- The programmed fuel injection system is equipped with the Self-Diagnostic System described on page 5-6. If the warning indicator blinks, follow the Self-Diagnostic Procedures to remedy the problem.
- When checking the PGM-FI, always follow the steps in the troubleshooting flow chart (page 5-10).
- The PGM-FI system is provided with fail-safe function to secure a minimum running capability even when there is any trouble in the system. When any abnormality is detected by the self-diagnosis function, running capability is secured by making use of the numerical values of a situation preset in advance in the simulated program map. It must be remembered, however, that when any abnormality is detected in four injectors and/or the ignition and cam pulse generator, the fail safe function stops the engine from the standpoint of protecting it.

- For PGM-FI system location, see page 5-4.
- A faulty PGM-FI system is often related to poorly connected or corroded connectors. Check those connections before proceeding.
- For fuel level sensor inspection, see section 19.
- The vehicle speed sensor sends digital pulse signal to the ECM (PGM-FI unit) and computation. For vehicle speed sensor inspection, see section 19.
- When disassembling the programmed fuel injection parts, note the location of the O-rings. Replace them with new ones upon reassembly.
- Before disconnecting the fuel tube, release the fuel pressure by loosening the service check bolt at the fuel tank.
- Always replace the sealing washers when the fuel tube banjo bolt is removed or loosened.
- Use a digital tester for PGM-FI system inspection.

PGM-FI (PROGRAMMED FUEL INJECTION) SYSTEM

SELF-DIAGNOSTIC PROCEDURES

Place the motorcycle on its side stand.
Start the engine and let it idle.

If the malfunction indicator does not light or blink, the system has no memory of problem data.
If the malfunction indicator blinks, note how many times the malfunction indicator blinks, and determine the cause of the problem (page 5-10 through 5-46).

NOTE:

The malfunction indicator will start blinking only when the engine revs are below 5,000 min⁻¹ (rpm) with the side stand down. In any other conditions, the malfunction indicator will illuminate and stay on.

If you wish to read the PGM-FI memory for trouble data, perform the following:

Turn the ignition switch OFF.

Remove the seat (page 2-2).

Short the PGM-FI system service check connector terminals using a jumper wire.

(30)	Malfunction indicator
(31)	Immobilizer indicator

Turn the ignition switch ON.

If the ECM has no self diagnosis memory data, the malfunction indicator will illuminate, when you turn the ignition switch ON.

If the ECM has self diagnosis memory data, the malfunction indicator will start blinking when you turn the ignition switch ON.

NOTE:

Even if the PGM-FI has memory data, the malfunction indicator only illuminates (no blinking) under engine running conditions (side stand up and revs above 5,000 min⁻¹ (rpm)).

Note how many times the malfunction indicator blinks, and determine the cause of the problem (page 5-10 through 5-50).

SELF-DIAGNOSIS RESET PROCEDURE

1. Turn the ignition switch OFF.
2. Short the service check connector of the PGM-FI system using a jumper wire.
3. Turn the ignition switch ON.
4. Remove the jumper wire from the service check connector.
5. The malfunction indicator lights about 5 seconds. While the indicator lights, short the service check connector again with the jumper wire. Self diagnosis memory data is erased, if the malfunction indicator turn off and start blinking.

NOTE:

- The service check connector must be jumped while the indicator lights. If not, the malfunction indicator will not start blinking.
- Note that the self diagnosis memory data cannot be erased if you turn off the ignition switch before the malfunction indicator starts blinking.

If the malfunction indicator blinks 20 times, the data has not been erased, so try again.

PEAK VOLTAGE INSPECTION PROCEDURE

NOTE:

- Use this procedure for the ignition pulse generator and cam pulse generator inspection.
- Check all system connections before inspection. If the system is disconnected, incorrect peak voltage might be measured.
- Check cylinder compression and check that the all spark plugs are installed correctly.
- Use recommended digital multimeter or commercially available digital multimeter with an impedance of 10 M Ω /DCV minimum.
- The display value differs depending upon the internal impedance of the multimeter.
- Disconnect the fuel pump 2P (black) connector before checking the peak voltage.

Support the rear end of the fuel tank (page 2-11).

Disconnect the fuel pump 2P (Black) connector.

Connect the peak voltage adaptor to the digital multimeter.

PGM-FI SELF-DIAGNOSIS MALFUNCTION INDICATOR FAILURE CODES

- The PGM-FI malfunction indicator denotes the failure codes (the number of blinks from 0 to 33). When the indicator lights for 1.3 seconds it is equivalent to ten blinks. For example, a 1.3 second illumination and two blinks (0.5 second × 2) of the indicator equals 12 blinks. Follow code 12 on page 5-26).
- When more than one failure occurs, the malfunction indicator shows the blinks in the order of lowest number to highest number. For example, if the indicator blinks once, then two times, two failures have occurred. Follow codes 1 and 2 on page 5-12).

A voltage marked* refers to the value when the voltage reading at the TP sensor 3P connector (page 5-19) shows 5V. When the reading shows other than 5 V, derive a voltage at the test harness as follows:

In the case of a voltage of 4.75 V at the TP sensor 3P connector:

$$0.4 \times 4.75/5.0 = 0.38 \text{ V}$$

$$0.6 \times 4.75/5.0 = 0.57 \text{ V}$$

TROUBLESHOOTING

- Engine top-end problems usually affect engine performance. These problem can be diagnosed by a compression test or by tracing engine noises to the top-end with a sounding rod stethoscope.
- If the performance is poor at low speeds, check for white smoke in the crankcase breather tube. If the tube is smoky, check for a seized piston ring (Section 11).

Compression too low, hard starting or poor performance at low speed

- Valves:
 - Incorrect valve adjustment
 - Burned or bent valve
 - Incorrect valve timing
 - Broken valve spring
 - Uneven valve seating
- Cylinder head:
 - Leaking or damaged head gasket
 - Warped or cracked cylinder head
- Worn cylinder, piston or piston rings (Section 11)

Excessive noise

- Cylinder head:

CYLINDER COMPRESSION TEST

▲WARNING

If the engine must be running to do some work, make sure that the area is well-ventilated. Never run the engine in an enclosed area. The exhaust contains poisonous carbon monoxide gas that may cause loss of consciousness and may lead to death. Run the engine in an open area or with an exhaust evacuation system in enclosed area.

Warm up the engine to normal operating temperature.

Stop the engine and remove the all spark plug caps and spark plugs (page 3-7).

Support the rear end of the fuel tank (page 2-11).

Disconnect the pump/reserve sensor 2P (Black) connector.

Install a compression gauge into the spark plug hole.

TOOL:

Compression gauge attachment 07RMJ-MY50100
(Equivalent commercially available)

Open the throttle all the way and crank the engine with the starter motor until the gauge reading stops rising.

The maximum reading is usually reached within 4–7 seconds.

NOTE:

To avoid discharging the battery, do not operate the starter motor for more than seven seconds.

Compression pressure:

1,275 kPa (13.0 kgf/cm², 185 psi) at
350 min⁻¹ (rpm)

Low compression can be caused by:

- Blown cylinder head gasket
- Improper valve adjustment
- Valve leakage
- Worn piston ring or cylinder

High compression can be caused by:

- Carbon deposits in combustion chamber or on piston head

Use a 60-degree cutter to remove the bottom 1/4 of the old seat. Remove the cutter and inspect the area you have refaced.

Install a 45-degree finish cutter and cut the seat to the proper width.
 Make sure that all pitting and irregularities are removed.
 Refinish if necessary.

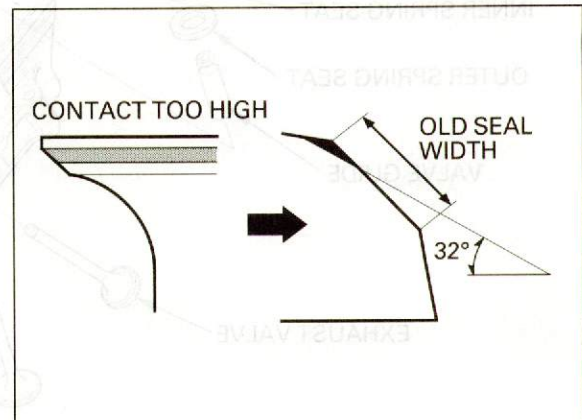

The location of the valve seat in relation to the valve face is very important for good sealing.

Apply a thin coating of Prussian Blue to the valve seat.

Press the valve through the valve guide and onto the seat to make a clear pattern.

If the contact area is too high on the valve, the seat must be lowered using a 32 degrees flat cutter.

If the contact area is too low on the valve, the seat must be raised using a 60-degree inner cutter.

Refinish the seat to specifications, using a 45-degree finish cutter.

After cutting the seat, apply lapping compound to the valve face, and lap the valve using light pressure.

Do not allow lapping compound to enter the guides.

After lapping, wash all residual compound off the cylinder head and valve.

SERVICE INFORMATION

GENERAL

- This section covers crankcase separation for service of the crankshaft and piston.
- The following parts must be removed before separating the crankcase.
 - Alternator/flywheel (Section 10)
 - Clutch/gearshift linkage (Section 9)
 - Cylinder head (Section 8)
 - Engine (Section 6)
 - Oil pump (Section 4)
- Mark and store the disassemble parts to ensure that they are installed in their original locations.
- Mark and store the bearing inserts to be sure of their correct locations for reassembly. If the inserts are improperly installed, they will block the oil hole, causing insufficient lubrication and eventual engine seizure.
- The connecting rod bearing inserts are select fit and are identified by color codes. Select replacement bearings from the code tables. After installing new bearings, recheck them with plastigauge to verify clearance. Apply molybdenum disulfide oil to the crank pin during assembly.

SERVICE INFORMATION

GENERAL

- The crankcase must be separated to service the crankshaft, transmission and balancer. Refer to section 11 for crankcase separation/assembly.
- Be careful not to damage the crankshaft main journal and journal bearing while removing or installing the crankshaft.
- Mark and store the disassembled parts to ensure that they are installed in their original locations.
- Mark and store the bearing inserts to ensure that the parts are in their correct locations during reassembly. If the inserts are improperly installed, they will block the oil hole, causing insufficient lubrication and eventual engine seizure.
- The main journal bearing inserts are a select fit and are identified by color codes. Select replacement bearings from the code tables. After installing new bearings, recheck them with a plastigauge to verify clearance. Apply molybdenum disulfide oil to the main journal during assembly.

BACKLASH ADJUSTMENT

NOTE:

Adjust the backlash while the engine is cold (below 35°C/95°F) and the engine stopped.

Remove the balancer shaft holder pinch bolt.

Turn the balancer shaft clockwise until the resistance is felt, then back it off one graduation using the punch mark as a measure.

Warm up the engine and let it idle.

If the balancer gear noises excessive, adjust the balancer backlash as follows:

1. Turn the balancer shaft clockwise until the gears begin to make a "whining" noise. Then, turn the gear shaft counterclockwise until the gear "whine" noise disappears.

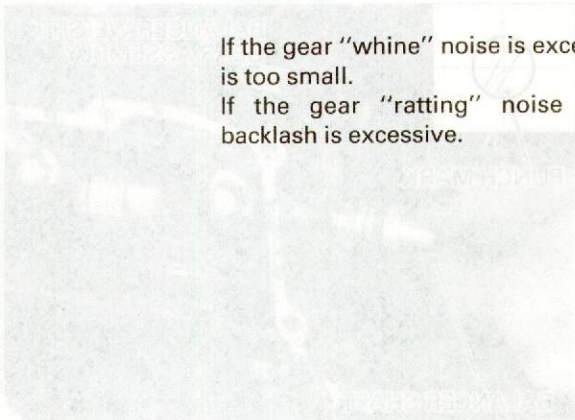

Tighten the gear shaft pinch bolt to the specified torque.

TORQUE: 12 N·m (1.2 kgf·m, 9 lbf·ft)

After gear backlash adjustment is done, snap the throttle and make sure the gear noises is no excessive.

If the gear "whine" noise is excessive, the backlash is too small.

If the gear "rattling" noise is excessive, the backlash is excessive.

INSPECTION

Axle

Set the axle in V-block and measure the runout. Actual runout is 1/2 the total indicator reading.

SERVICE LIMIT: 0.20 mm (0.008 in)

Wheel bearing

Turn the inner race of each bearing with your finger. The bearings should turn smoothly and quietly. Also check that the bearing outer race fits tightly in the hub.

Replace the bearings in pairs.

Remove and discard the bearings if they do not turn smoothly, quietly, or if they fit loosely in the hub.

Install the new bearings into the hub using the special tools (page 13-14).

Wheel rim runout

Check the rim runout by placing the wheel in a turning stand. Spin the wheel by hand, and read the runout using a dial indicator. Actual runout is 1/2 the total indicator reading.

SERVICE LIMITS:

Radial: 2.0 mm (0.08 in)

Axial: 2.0 mm (0.08 in)

Wheel balance

CAUTION:

Wheel balance directly affects the stability, handling and over all safety of the motorcycle. Always check balance when the tire has been removed from the rim.

NOTE:

For optimum balance, the tire balance mark (a paint dot on the side wall) must be located next to the valve stem. Remount the tire if necessary.

NOTE:

Note the rotating direction marks on the wheel and tire.

Remove the dust seals from the wheel.
 Mount the wheel, tire and brake discs assembly in an inspection stand.
 Spin the wheel, allow it to stop, and mark the lowest (heaviest) point of the wheel with a chalk.
 Do this two or three times to verify the heaviest area.
 If the wheel is balanced, it will not stop consistently in the same position.

To balance the wheel, install wheel weights on the highest side of the rim, the side opposite the chalk marks. Add just enough weight so the wheel will no longer stop in the same position when it is spun. Do not add more than 60 grams to the wheel.

DISASSEMBLY

Remove the bolts and brake discs.
 Remove the dust seals.

Install the bearing remover head into the bearing.
 From the opposite side, install the bearing remover shaft and drive the bearing out of the wheel hub.

Support the damper in a vise as shown.
Through the open end of the bag, insert a drill motor with a sharp 2–3 mm (5/64 – 1/8 in) drill bit.

▲ WARNING

- *Do not use a dull drill bit which could cause a build-up of excessive heat and pressure inside the damper, leading to explosion and severe personal injury.*
- *The shock absorber contains nitrogen gas and oil under high pressure. Do not drill any farther down the damper case than the measurement given above, or you may drill into the oil chamber; oil escaping under high pressure may cause serious personal injury.*
- *Always wear eye protection to avoid getting metal shaving in your eyes when the gas pressure is released. The plastic bag is only intended to shield you from the escaping gas.*

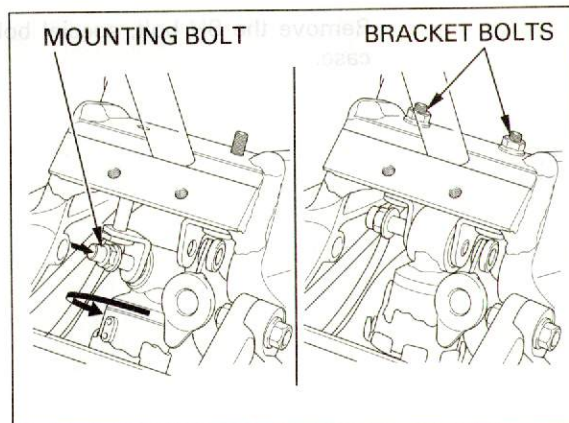

Hold the bag around the drill motor and briefly run the drill motor inside the bag; this will inflate the bag with air from the motor and help keep the bag from getting caught in the bit when you start.

GENERAL

▲WARNING

- A contaminated brake disc or pad reduces stopping power. Discard contaminated pads and clean a contaminated disc with a high quality brake degreasing agent.
- Check the brake system by applying the brake lever and pedal after the air bleeding.

CAUTION:

- This model equipped with a Dual Combined Brake System. Must be follow the system air bleeding procedure (page 15-5) if you disconnect or service any part of the brake hydraulic system.
- Do not disassemble the secondary master cylinder push rod or the correct brake performance will not be obtained.

- Spilled brake fluid will severely damage instrument lenses and painted surfaces. It is also harmful to some rubber parts. Be careful whenever you remove the reservoir cap; make sure the front reservoir is horizontal first.
- Never allow contaminants (dirt, water, etc.) to get into an open reservoir.
- Once the hydraulic system has been opened, or if the brake feels spongy, the system must be bled.
- Always use fresh DOT 4 brake fluid from a sealed container when servicing the system. Do not mix different types of fluid they may not be compatible.
- Always check brake operation before riding the motorcycle.

BRAKE FLUID REPLACEMENT/ AIR BLEEDING

⚠WARNING

A contaminated brake disc or pad reduces stopping power. Discard contaminated pads and clean a contaminated disc with a high quality brake degreasing agent.

CAUTION:

- Do not allow foreign material to enter the system when filling the reservoir.
- Avoid spilling fluid on painted, plastic, or rubber parts. Place a rag over these parts whenever the system is serviced.

NOTE:

- The lever brake line air bleeding procedure is performed in the same manner as in the ordinal air bleeding procedure.
- Once the hydraulic system has been opened, or if the brake feels spongy, the system must be bled.
- When using a commercially available brake bleeder, follow the manufacturer's operating instructions.

BRAKE FLUID DRAINING

Lever brake line

Support the motorcycle on its center stand. Turn the handlebar to the left until the reservoir is parallel to the ground, before removing the reservoir cap.

BRAKE FLUID FILLING/AIR BLEEDING

Lever brake line

Fill the reservoir with DOT 4 brake fluid from a sealed container.

CAUTION:

- Use only DOT 4 brake fluid from a sealed container.
- Do not mix different types of fluid. They are not compatible.

Operate the brake lever several times to bleed air from the master cylinder.

Connect a commercially available brake bleeder to the outer bleed valve.

Pump the brake bleeder and loosen the bleed valve, adding fluid when the fluid level in the master cylinder reservoir is low.

NOTE:

- Check the fluid level often while bleeding the brakes to prevent air from being pumped into the system.
- When using a brake bleeding tool, follow the manufacturer's operating instructions.

HYDRAULIC BRAKE

If air is entering the bleeder from around the bleed valve threads, seal the threads with teflon tape.

Repeat the above step procedures until air bubbles do not appear in the plastic hose.

Close the bleed valve.

Operate the brake lever and check brake operation. If it still feels spongy, bleed the lever system again.

If a brake bleeder is not available, use the following procedure:

Connect a transparent bleed hose to the bleed valve and place the outer end of the hose in a container.

Loosen the bleed valve 1/4 turn and pump the brake lever until the brake fluid flows out from the bleed valve.

1. Pump the brake lever several times, then squeeze the brake lever all the way and loosen the bleed valve 1/4 turn. Wait several seconds and close the bleed valve.

NOTE:

Do not release the brake lever until the bleed valve has been closed.

2. Release the brake lever slowly until the bleed valve has been closed.
3. Repeat the steps 1–2 until there are no air bubbles in the bleed hose.

After bleeding air completely and tighten the bleed valves to the specified torque.

TORQUE: 6 N·m (0.6 kgf·m , 4.3 lbf·ft)

HYDRAULIC BRAKE

Rear master cylinder to front brake caliper lines:

When using a brake bleeder, follow the manufacturer's operating instructions.

1. Connect a commercially available brake bleeder to the right front brake caliper center bleed valve. Pump the brake bleeder and loosen the bleed valve. Operate the brake bleeder and feed the brake fluid until fluid flow out from the bleeder valve. Close the bleeder valve.

2. Feed the brake fluid at the left front brake caliper center bleeder valve as same procedure in step 1.

Secondary master cylinder to rear brake caliper line:

3. Feed the brake fluid at the rear brake caliper outer bleeder valve as same procedure in step 1.
4. Repeat step 1-7 until the pedal resistance is felt.

Rear master cylinder to rear brake caliper line:

5. Feed the brake fluid at the rear brake caliper center bleeder valve as same procedure in step 1.

Next bleed the air from the system without using a brake bleeder tool.

HYDRAULIC BRAKE

Connect the transparent bleeder tube to the bleed valve and place the outer end of the hose in a container.

1. Pump the brake pedal 5-10 times, then release the pedal.
Loosen the bleed valve, then pushing down the brake pedal all the way.

NOTE:

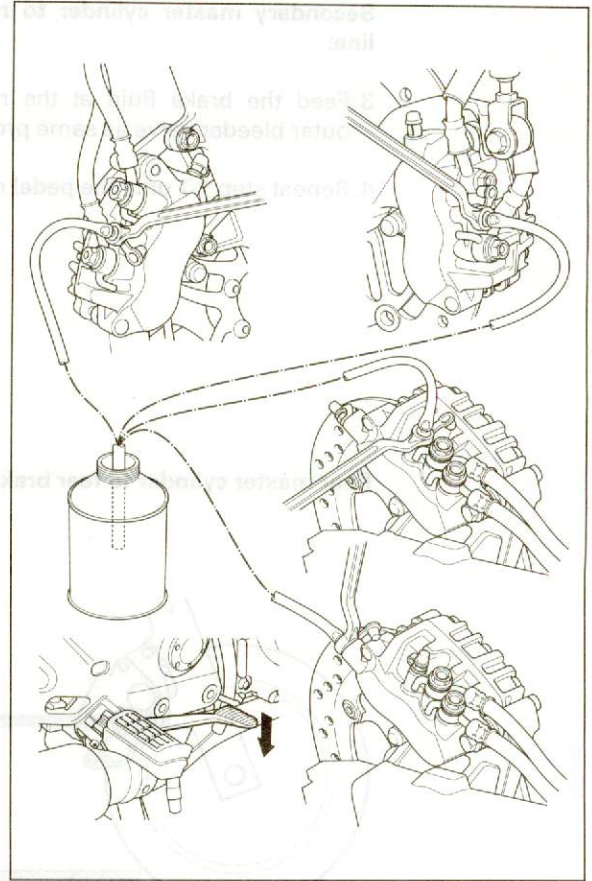

Do not release the brake pedal while opening the bleed valve.

Close the bleed valve.

2. Release the brake pedal slowly and wait several seconds after it reaches the end of its travel.
3. Repeat above step 1 and 2 until bubbles cease to appear in the fluid at the end of the bleed tube and pedal resistance is felt.

NOTE:

- After the bubbles cease to appear in the fluid, repeat air bleeding procedure about 2-3 times.
- Elaborately bleed the air from the rear brake caliper center bleeder valve (from secondary master cylinder-to-PCV-to-rear brake caliper line).

Tighten the each bleed valve to the specified torque.

SERVICE INFORMATION

GENERAL

▲WARNING

- The battery gives off explosive gases; keep sparks, flames and cigarettes away. Provide adequate ventilation when charging.
- The battery contains sulfuric acid (electrolyte). Contact with skin or eyes may cause severe burns. Wear protective clothing and a face shield.
 - If electrolyte gets on your skin, flush with water.
 - If electrolyte gets in your eyes, flush with water for at least 15 minutes and call a physician immediately.
- Electrolyte is poisonous.
 - If swallowed, drink large quantities of water or milk and follow with milk of magnesia or vegetable oil and call a physician. **KEEP OUT OF REACH OF CHILDREN.**

- Always turn off the ignition switch before disconnecting any electrical component.

CAUTION:

Some electrical components may be damaged if terminals or connectors are connected or disconnected while the ignition switch is ON and current is present.

- For extended storage, remove the battery, give it a full charge, and store it in a cool, dry space. For maximum service life, charge the stored battery every two weeks.
- For a battery remaining in a stored motorcycle, disconnect the negative battery cable from the battery terminal.

NOTE:

The maintenance free battery must be replaced when it reaches the end of its service life.

CAUTION:

The battery caps should not be removed. Attempting to remove the sealing caps from the cells may damage the battery.

- The battery can be damaged if overcharged or undercharged, or if left to discharge for long period. These same conditions contribute to shortening the "life span" of the battery. Even under normal use, the performance of the battery deteriorates after 2–3 years.
- Battery voltage may recover after battery charging, but under heavy load, battery voltage will drop quickly and eventually die out. For this reason, the charging system is often suspected as the problem. Battery overcharge often results from problems in the battery itself, which may appear to be an overcharging symptom. If one of the battery cells is shorted and battery voltage does not increase, the regulator/rectifier supplies excess voltage to the battery. Under these conditions, the electrolyte level goes down quickly.
- Before troubleshooting the charging system, check for proper use and maintenance of the battery. Check if the battery is frequently under heavy load, such as having the headlight and taillight ON for long periods of time without riding the motorcycle.

BATTERY/CHARGING SYSTEM

- The battery will self-discharge when the motorcycle is not in use. For this reason, charge the battery every two weeks to prevent sulfation from occurring.
- Filling a new battery with electrolyte will produce some voltage, but in order to achieve its maximum performance, always charge the battery. Also, the battery life is lengthened when it is initially charged.
- When checking the charging system, always follow the steps in the troubleshooting flow chart (page 16-3).

Battery charging

This model comes with a maintenance-free (MF) battery. Remember the following about MF batteries.

- Use only the electrolyte that comes with the battery
- Use all of the electrolyte
- Seal the battery properly
- Never open the seals again

CAUTION:

For battery charging, do not exceed the charging current and time specified on the battery. Use of excessive current or charging time may damage the battery.

BATTERY TESTING

Refer to the instruction of the Operation Manual for the recommended battery tester. The recommended battery tester puts a "load" on the battery so that the actual battery condition of the load can be measured.

Recommended battery tester BM-210 or BATTERY MATE or equivalent

For this reason, the charging system is often suspected as the problem. Battery overcharge often results from problems in the battery itself, which may appear to be an overcharging symptom. If one of the battery cells is shorted and battery voltage does not increase, the regulator/rectifier supplies excess voltage to the battery. Under these conditions, the electrolyte level goes down quickly.

• Before troubleshooting the charging system, check for proper use and maintenance of the battery. Check if the battery is frequently under heavy load, such as leaving the headlight and taillight ON for long periods of time without riding the motorcycle.

BATTERY

REMOVAL/INSTALLATION

Always turn the ignition switch OFF before removing the battery.

Remove the seat (page 2-2).
 Remove the battery holder band. Disconnect the negative cable and then the positive cable, and remove the battery.

Install the battery in the reverse order of removal with the proper wiring as shown.

NOTE:

Connect the positive terminal first and then the negative cable.

After installing the battery, coat the terminals with clean grease.
 Reinstall the removed parts.

VOLTAGE INSPECTION

Measure the battery voltage using a digital multimeter.

VOLTAGE:

- Fully charged: 13.0 – 13.2 V
- Under charged: Below 12.3 V

TOOL:

Digital multimeter Commercially available

BATTERY CHARGING

▲WARNING

- The battery gives off explosive gases; keep sparks, flames and cigarettes away. Provide adequate ventilation when charging.
- Turn power ON/OFF at the charger, not at the battery terminal.

Remove the battery (see above).

Connect the charger positive (+) cable to the battery positive (+) terminal.
 Connect the charger negative (-) cable to the battery negative (-) terminal.

CAUTION:

- Quick-charging should only be done in an emergency; slow charging is preferred.
- For battery charging, do not exceed the charging current and time specified on the battery. Using excessive current or extending the charging time may damage the battery.

CHARGING SYSTEM INSPECTION

NOTE:

- When inspecting the charging system, check the system components and lines step-by-step according to the troubleshooting on page 16-3.
- Measuring circuits with a large capacity that exceeds the capacity of the tester may cause damage to the tester. Before starting each test, set the tester at the highest capacity range first, then gradually lower the capacity ranges until you have the correct range.
- When measuring small capacity circuits, keep the ignition switch off. If the switch is suddenly turned on during a test, the tester fuse may blow.

CHARGING VOLTAGE INSPECTION

▲WARNING

If the engine must be running to do some work, make sure the area is well-ventilated. Never run the engine in an enclosed area. The exhaust contains poisonous carbon monoxide gas that may cause loss of consciousness and lead to death. Run the engine in an open area or with an exhaust evacuation system in an enclosed area.

Be sure the battery is in good condition before performing this test.

Warm up the engine to normal operating temperature. Stop the engine, and connect the multimeter as shown.

CAUTION:

- ***To prevent a short, make absolutely certain which are the positive and negative terminals or cable.***
- ***Do not disconnect the battery or any cable in the charging system without first switching off the ignition switch. Failure to follow this precaution can damage the tester or electrical components.***

Restart the engine.

With the headlight on Hi beam, measure the voltage on the multimeter when the engine runs at 5,000 min⁻¹ (rpm).

Standard: Measured battery voltage (page 16-5) < Measured charging voltage (see above) < 15.5 V at 5,000 min⁻¹ (rpm)

CURRENT LEAKAGE INSPECTION

Turn the ignition switch off and disconnect the negative battery cable from the battery. Connect the ammeter (+) probe to the ground cable and the ammeter (-) probe to the battery (-) terminal. With the ignition switch off, check for current leakage.

NOTE:

- When measuring current using a tester, set it to a high range, and then bring the range down to an appropriate level. Current flow higher than the range selected may blow out the fuse in the tester.
- While measuring current, do not turn the ignition on. A sudden surge of current may blow out the fuse in the tester.

SPECIFIED CURRENT LEAKAGE: 0.2 mA max.

If current leakage exceeds the specified value, a shorted circuit is likely. Locate the short by disconnecting connections one by one and measuring the current.

ALTERNATOR CHARGING COIL

NOTE:

It is not necessary to remove the stator coil to make this test.

INSPECTION

Support the rear end of the fuel tank (page 2-11).

Disconnect the regulator/rectifier 3P (White) connector.

Check the resistance between all three Yellow terminals.

STANDARD: 0.1 – 1.0 Ω (at 20 °C/68 °F)

Check for continuity between all three Yellow terminals and Ground. There should be no continuity.

If readings are far beyond the standard, or if any wire has continuity to ground, replace the alternator stator. Refer to section 10 for stator removal.

REGULATOR/RECTIFIER

SYSTEM INSPECTION

Remove the rear cowl (page 2-2).
Support the rear end of the fuel tank (page 2-11).

Disconnect the regulator/rectifier connectors, and check it for loose contact or corroded terminals.

If the regulated voltage reading (see page 16-6) is out of the specification, measure the voltage between connector terminals (wire harness side) as follows:

Item	Terminal	Specification
Battery charging line	Red/White (+) and ground (-)	Battery voltage should register
Charging coil line	Yellow and Yellow	0.1 – 1.0 Ω (at 20 °C/68 °F)
Ground line	Green and ground	Continuity should exist

If all components of the charging system are normal and there are no loose connections at the regulator/rectifier connectors, replace the regulator/rectifier unit.

REMOVAL/INSTALLATION

Remove the rear cowl (page 2-2).
Support the rear end of the fuel tank (page 2-11).

Disconnect the alternator 3P (White) connector.
Disconnect the alternator 6P (Black) connector.

Remove the regulator/rectifier unit mounting bolts and regulator/rectifier.

Install the regulator/rectifier unit in the reverse order of removal.

▲WARNING

If the engine must be running to do some work, make sure the area is well-ventilated. Never run the engine in an enclosed area. The exhaust contains poisonous carbon monoxide gas that may cause loss of consciousness and lead to death. Run the engine in an open area or with an exhaust evacuation system in an enclosed area.

CAUTION:

Some electrical components may be damaged if terminals or connectors are connected or disconnected while the ignition switch is ON and current is present.

- When servicing the ignition system, always follow the steps in the troubleshooting sequence on page 17-3.
- This motorcycle's Ignition Control Module (ICM) is built into the Engine Control Module (ECM).
- The ignition timing does not normally need to be adjusted since the ECM is factory preset.
- The ECM may be damaged if dropped. Also if the connector is disconnected when current is flowing, the excessive voltage may damage the module. Always turn off the ignition switch before servicing.
- A faulty ignition system is often related to poor connections. Check those connections before proceeding. Make sure the battery is adequately charged. Using the starter motor with a weak battery results in a slower engine cranking speed as well as no spark at the spark plug.
- Use spark plug of the correct heat range. Using spark plug with an incorrect heat range can damage the engine.
- Refer to section 5 for Throttle Position (TP) sensor and ECM inspection.

IGNITION COIL PRIMARY PEAK VOLTAGE

▲WARNING

Avoid touching the spark plugs and tester probes to prevent electric shock.

NOTE:

- Check all system connections before inspection. If the system is disconnected, incorrect peak voltage might be measured.
- Check cylinder compression and check that the spark plugs are installed correctly.

Shift the transmission into neutral and disconnect the all spark plug caps from the spark plugs. Connect a known good spark plugs to the spark plug caps and ground the spark plugs to the cylinder as done in a spark test.

With the ignition coil primary wire connected, connect the peak voltage adaptor or Imrie tester to the ignition coil.

CONNECTION:

No. 1/4 coil:
Yellow/Blue terminal (+) – Body ground (-)

No. 2/3 coil:
Blue/Yellow terminal (+) – Body ground (-)

Turn the ignition switch "ON" and engine stop switch to "RUN".

Check for initial voltage at this time.

The battery voltage should be measured.

If the initial voltage cannot be measured, check the power supply circuit (refer to the troubleshooting, page 17-3).

Crank the engine with the starter motor and read ignition coil primary peak voltage.

PEAK VOLTAGE: 100 V minimum

If the peak voltage is abnormal, check for an open circuit or poor connection in Yellow/Blue and Blue/Yellow wires.

If not defects are found in the harness, refer to the troubleshooting chart on page 17-3.

CONNECTION:

Yellow terminal (+) – White/Yellow (-)

Crank the engine with the starter motor and read the peak voltage.

Support the rear end of the fuel tank (page 2-11).

Disconnect the ignition pulse generator 2P (Red) connector and connect the tester probes to the terminal (Yellow and White/Yellow). In the same manner as at the ECM connector, measure the peak voltage and compare it to the voltage measured at the ECM connector.

- If the peak voltage measured at the ECM is abnormal and the one measured at the ignition pulse generator is normal, the wire harness has an open circuit or loose connection.
- If both peak voltages measure are abnormal, check each item in the troubleshooting chart. If all items are normal, the ignition pulse generator is faulty.

SERVICE INFORMATION

GENERAL

- HISS is the abbreviation of Honda Ignition Security System.
- When checking the immobilizer system (HISS), always follow the steps in the troubleshooting flow chart (page 20-7).
- Keep the immobilizer key away from the other vehicle's immobilizer key when using it. The jamming of the key code signal may occur and the proper operation of the system will be obstructed.
- The key has built-in electronic part (transponder). Do not drop and strike the key against a hard material object, and do not leave the key on the dashboard in the car, etc. where the temperature will rise. Do not leave the key in the water for a prolonged time such as by washing the clothes.
- The engine control module (ECM) as well as the transponder keys must be replaced if all transponder keys have been lost.
- The system does not function with a duplicated key unless the code is registered into the transponder with the immobilizer system (HISS).
- The ECM can store up to four key codes. (The four keys can be registered.)
- Do not modify the immobilizer system (HISS) as it can cause the system failure. (The engine cannot be started.)
- For ignition system inspection, see section 17.
- For ignition switch servicing, see section 19.

TOOL

Inspection adaptor 07XMZ-MBW0100

IMMOBILIZER INDICATOR

Remove the headlight unit (page 19-4).

Perform the following inspections with the combination meter 9P (Black) connector connected.

POWER INPUT LINE INSPECTION

Measure the voltage between the Black/Brown (+) and Green (-) wire terminals.

Turn the ignition switch ON.

There should be battery voltage.

IMMOBILIZER INDICATOR LINE INSPECTION

Measure the voltage between the White/Red (+) and Green (-) wire terminals.

Turn the ignition switch ON.

There should be battery voltage.

NOTE:

There should be no voltage for approx. two seconds after the ignition switch is turned ON, then the battery voltage should appear, if the system is normal.

ENGINE CONTROL MODULE (ECM)

Remove the seat (page 2-2).

Disconnect the ECM 22P multi-connector.
Perform the following inspections at the wire harness side connector of the ECM.

IMMOBILIZER INDICATOR LINE INSPECTION

Measure the voltage between the White/Red wire terminal (+) and ground (-).

Turn the ignition switch ON.

There should be battery voltage.

POWER INPUT LINE INSPECTION

Measure the voltage between the Black/White wire terminal (+) and ground (-).

Turn the ignition switch ON.

There should be battery voltage.

GROUND LINE INSPECTION

Check for continuity between the Green wire terminal and ground.
There should be continuity at all times.

IGNITION PULSE GENERATOR LINE INSPECTION

Disconnect the ignition pulse generator 2P (Red) connector (page 20-5).

Check the Yellow and White/Yellow wires for continuity between the ECM and ignition pulse generator connectors.
There should be continuity between the same color wire terminals.

IMMOBILIZER RECEIVER

Remove the headlight unit (page 19-4).

Disconnect the immobilizer receiver 4P (Natural) connector.

POWER INPUT LINE INSPECTION

Measure the voltage between the Yellow/Red wire terminal (+) of the wire harness side connector and ground (-).

Turn the ignition switch ON.
There should be approx. 5 V.

GROUND LINE INSPECTION

Check for continuity between the Green/Orange wire terminal of the wire harness side connector and ground.
There should be continuity at all times.

IMMOBILIZER SYSTEM (HISS)

SIGNAL LINE INSPECTION

Measure the voltage between the Pink wire terminal (+) of the wire harness side connector and ground (-).
Turn the ignition switch ON.
There should be approx. 5 V.

Remove the seat (page 2-2).

Disconnect the engine control module (ECM) connector.
Check the Orange/Blue wire for continuity between the immobilizer receiver and ECM connectors.
There should be continuity.

Check for continuity between the Orange/Blue wire terminal and ground.
There should be no continuity.

REPLACEMENT

Remove the wire band.
Remove the two screws and the immobilizer receiver.

Install a new receiver and tighten the two screws.
Route the receiver wire properly (page 1-24).

Install the removed part in the reverse order of removal.
